

Kangpo Wang

Backend Engineer with 5+ years of experience modernizing mission-critical enterprise systems and building scalable backend architectures using C# and .NET.

Specialized in legacy system migration, insurance domain logic refactoring, ERP optimization, and automation-driven efficiency improvements.

Experienced in asynchronous collaboration within distributed teams and delivering production-ready backend services.

Work Experience

Software Engineer

Yifan Technology Co., Ltd. — May 2024 – May 2025

- Led the migration of a legacy VB6 motor insurance system to a modular C#/.NET backend architecture
- Refactored complex insurance workflows (policy calculation, risk assessment, claims processing) into scalable, testable backend services
- Reduced technical debt by decoupling tightly coupled legacy components and improving system maintainability
- Collaborated with business stakeholders to translate domain-heavy insurance rules into structured backend logic

Software Engineer

PX Mart Co., Ltd. — Apr 2022 – Mar 2024

- Optimized ERP database connection handling to improve stability under concurrent workloads
- Designed and implemented RBAC mechanisms to secure internal enterprise systems
- Automated manual operational processes through scheduled backend jobs, reducing human intervention and operational risk
- Developed .NET MAUI mobile prototypes to validate system architecture and future product features

Research Assistant

Industrial Control Center, China University of Technology — Jul 2017 – Jul 2020

- **Smart Lighting Control System:**
Implemented real-time device control using **MQTT** to connect mobile applications with lighting systems, projectors, and screens; designed user interfaces and interaction flows, including multiple usage modes to simplify operation and improve user experience
- **Autonomous Drone Tracking System:**
Developed automated camera control logic to dynamically adjust camera orientation based on tracking results, and contributed to the training process of drone recognition models to enable object identification and tracking
- **Smart Roadside Parking System:**
Integrated multiple systems through APIs to consolidate parking order data; implemented business logic for parking duration and fee calculation, ensuring accurate billing and consistent data processing

Education

China University of Technology – 2017 – 2021

- **Awards & Projects – International ICT Innovative Services Awards**
 - 🏆 **First Place**, 22nd Information Application Competition
Led **Open Data integration** projects involving encryption, data segmentation, and push notification systems to enhance public engagement.
 - 🏆 **Third Place**, 23rd Industry-Academic Collaboration – Feitsui Reservoir IoT Project
Developed a **LoRa-based smart water resource management platform** integrating hydrological, meteorological, and security data across remote areas.
 - 🏆 **Honorable Mention**, 24th Smart Manufacturing AI Innovation
Built an **AI vision system** to verify cleanroom attire; integrated it with access control and iterative training to improve accuracy.
 - 🏆 **First Place**, 25th Information Application Competition
Created **laser-based drone tracking software** for airport perimeter defense, enabling automatic detection and interception of intruding UAVs.

Skills

Languages & Tools: C#, SQL, Git, VB.NET, Java, Python

Frameworks & Platforms: .NET Framework, .NET, MAUI

Web Development: HTML, CSS, Bootstrap

Concepts & Domains: IoT (MQTT), Smart City Integration, AI Vision, Automation

Languages

- Chinese - Native
- English - Intermediate
